

FEDERAL - STATE COOPERATIVE
SNOW SURVEYS AND IRRIGATION WATER FORECASTS
for

**Montana and Northern Wyoming
Upper Missouri, Upper Columbia and
Yellowstone Rivers**

By
Division of Irrigation, Soil Conservation Service
United States Department of Agriculture
and
Montana Agricultural Experiment Station

In cooperation with the U. S. Forest Service, U. S. Geological Survey, National Park Service, U. S. Bureau of Reclamation, State Engineers of Montana and Wyoming and other Federal, State and local organizations.

As of
FEB. 1, 1952

FEDERAL-STATE COOPERATIVE SNOW SURVEYS

AND

IRRIGATION WATER FORECASTS

FOR

MONTANA and NORTHERN WYOMING

Upper Missouri and Upper Columbia River
Basins

Report Prepared
by

Ashton R. Codd: Hydraulic Engineer
Soil Conservation Service

and

O. W. Monson: Irrigation Engineer
Montana Agricultural Experiment Station

Division of Irrigation
Soil Conservation Service

and

Montana Agricultural Experiment Station
Bozeman, Montana

IRRIGATION WATER SUPPLY OUTLOOK
FOR SEASON 1952
AS OF FEBRUARY 1

The general outlook for irrigation water supply for the 1952 season is GOOD on the Upper Missouri and Upper Columbia River Basins. The Wind River Basin in Wyoming is a little short for this time of year. The snow pack at most stations measured on February 1 is above average and equal to, or greater than last year. Should snow accumulations occur as they usually do during February and March, there will be little question of having an EXCELLENT irrigation water supply this season. If the February-March accumulation is above average, the Columbia River Basin will experience another potential flood hazard. The snow pack is greater now than in 1948.

The amount of irrigation water in storage reservoirs throughout the state is very satisfactory for this time of year. There are no serious shortages. With the apparent ample storage in the snow pack, all reservoirs should fill before the irrigation season starts.

On the Jefferson River Basin, only a few adjacent courses are measured on February 1. However, general information would indicate that a GOOD water supply is in storage in the snow pack over this basin. Precipitation has been above average since the first of October.

On the Madison River Basin, the three courses at Hebgen, West Yellowstone and 21-Mile indicate that the snow pack is well above average--about 195% of the usual water content for February 1.

The Gallatin River Basin is likewise above average. Snow survey measurements on this basin show 165% average for February 1, and about equal to the average condition to be expected on April 1.

The snow survey courses along the Main Stem of the Missouri River are not quite as high in water content as the head water courses, but are still above average conditions. The snow survey course at Marias Pass indicates 147% average for February 1 water content.

The Upper Yellowstone River Basin from Yellowstone Park on East has recovered some since the first of January. The snow surveys made by the Park Service indicate an above average condition at this time.

The Lower Yellowstone River tributaries from Wyoming do not have an above average condition. The Wind River, in particular, and Owl Creek are both exceedingly short of water content by comparison with past years records. The Owl Creek courses are only four years old, while some of the Wind River courses extend back twelve years. There is plenty of time for this basin to recover during February and March and offset the present deficiency.

The snow survey measurements over the Upper Columbia River Basin are somewhat spotted in their values of above average condition, although in general, the entire basin is above average. Snow courses measured in Canada on the Kootenai River Basin are generally about 125% average for February 1.

February 1 snow survey measurements on the Flathead River Basin indicate an above average snow pack over the several tributaries. Most measurements are greater than those for the past five years and many of them are equal to, or are above the usual April 1 water content figures.

The snow pack over the Clark Fork River Basin is not quite as heavy as farther north, but still a good water supply is anticipated from this basin.

INDEX TO MONTANA & NORTHERN WYOMING SNOW COURSES
